SMT Endpoint Compliance

✓ Improve insight into environment

✓ Respond faster to auditors

✓ Better efficiency for Security Specialists

Are you looking for a way to report quickly and efficiently for internal and external audits? Would you like to improve your compliancy score without adding yet another tool? Or does your SOC ask you for historical data in order to add extra context to security incidents?

During a cyber security attack hackers are looking for the weakest link in an organisation, hence the need for all endpoints to meet the highest standards of compliancy. The SMT Endpoint Compliance solution provides a holistic view to what degree endpoints comply with your security policy and lets you take action to improve.

With SMT Endpoint Compliance you improve the insight into your environment, the reports make it possible to respond faster to your auditors and the work of your security specialists becomes more efficient. To protect these endpoints there is a minimum standard which should be part of the Security Policy. With SMT Endpoint Compliance you will gain insight into which level the endpoints comply to these standards. That is one of the first steps in the journey to Security Assurance.

SMT Endpoint Compliance aims to keep the standards at the highest level. You can deliver closing reports in a short time frame on the security status and simplify audits. Additionally, it provides knowledge to act on the required operational changes to improve the risk score. And in the situation of a security incident, the information provides extra context with historical data.

SMT Endpoint Compliance is of added value for:

- CISO's and SOC managers who steer for high performances and keep up with the compliancy standards.
- IT auditors who want to validate adherence to compliance standards quickly, efficiently and effectively.
- SOC analysts who use historical data to enrich context after a security incident.
- SecOps Engineer who want to make operational changes in the landscape to improve the risk score.

The SMT Endpoint Compliance app contains the following components:

Compliance checks

This is a collection of all benchmarks including the corresponding checks, such as the publicly available CIS benchmarks - Center for Internet Security. These benchmarks are translated into code which check whether or not the endpoint is compliant to the policies as described. It can now be checked automatically instead of manually.

Test runner

The component that is capable of processing large quantities of checks and forward the results to the Splunk HEC. The testrunner has multiple features to support your data needs.

Compliance dashboards

Overviews dedicated to the results of the testrunner based on the compliance checks. They provide insight into the current situation of the environment and the risk score of a specific endpoint. The dashboards also contain remediation steps for failed checks.

The benefits for your organisation:

- Built on top of Splunk, no need for additional agents or software
- Can be run agentless, even without a universal forwarder
- Expanding an existing solution
- Relatively little data per endpoint
- Scalable up to thousands of endpoints without a problem
- Works in on-premise and cloud-based Splunk instances
- Little or no additional training needed for Splunk administrators
- Not "yet another" tool that needs to be managed
- Simple roll-out will show results in minutes
- Can be used with open benchmarks (e.g. CIS) or internal policies

Keep your compliance standards at the highest level possible to protect your organisation. Eager to know how SMT Endpoint Compliance can help you achieve this? Contact our experts for more information about this product!
